awarded the american astronomical society aas rodger doxsey travel prize and with a foreword by thesis supervisor professor shardha jogee at the university of texas at austin this thesis discusses one of the primary outstanding problems in extragalactic astronomy how galaxies form and evolve galaxies consist of two fundamental kinds of structure rotationally supported disks and spheroidal triaxial structures supported by random stellar motions understanding the balance between these galaxy components is vital to comprehending the relative importance of the different mechanisms galaxy collisions gas accretion and internal secular processes that assemble and shape galaxies using panchromatic imaging from some of the largest and deepest space based galaxy surveys an empirical census of galaxy structure is made for galaxies at different cosmic epochs and in environments spanning low to extremely high galaxy number densities an important result of this work is that disk structures are far more prevalent in massive galaxies than previously thought the associated challenges raised for contemporary theoretical models of galaxy formation are discussed the method of galaxy structural decomposition is treated thoroughly since it is relevant for future studies of galaxy structure using next generation facilities like the james webb space telescope and the ground based giant magellan telescope with adaptive optics
